Introduction

In the last decade, Mers, Sarr and many more epidemics have been encountered and precautions were taken and solutions were found without a large spreading pattern. But although the World Health Organization (WHO) has released several reports in ten/twenty years stating that outbreaks are a major global threat, they have failed to integrate the states into a system to act harmonized on this issue.

The Corona epidemic, which started in Huan province of China just before 2020, was thought to experience a certain rise and then disappearing in the first months. However, this virus, which was first encountered in 2012, has evolved unexpectedly, spread to the whole world and became a threat to humanity. With the growth of the threat, the disease, which spread by Corona virus categorized in the

** ORCID: 0000-0002-5130-3322

pandemic group by World Health Organization and countries, started to fight on their own and no country could help the other.

This issue caused being unable to fight pandemic in a global system, which led each country to seek and develop a different method of struggle. As a result, large numbers of deaths were inevitably encountered. The consequence of not acting in an integrative system has caused states not to find solutions and to be inefficient in fighting, and it is still continuing.

Surely this pandemic will eventually be left behind and normal life will continue. However, there are important conclusions to be drawn. If these results are not analyzed and continue with the same logic, it will be inevitable that they will encounter much worse than the COVID 19 pandemic.

There are two main reasons for the rapid prevalence of diseases in a short period of time: institutional base and human base. The institutional reason is that, as stated in the reports prepared by WHO, there is no international cooperation required to keep the health security of the world population increasing by 7% every year. Today we can see clearly the consequences of this predicted cause with the pandemic of Covid 19.

However, the humanitarian cause contains much more important dimensions of unforeseen health security threats in the medium term. This is the main problematic issue in the article. Today, a considerable number of people will easily go all over the world and they will stay for different periods according to their purpose. This mobility can be classified into two main groups. The first is tourism. According to UNWTO (World Tourism Organization) statistical data (2019) tourism mobility is increasing by 4% every year. In 2019, the number of people engaged in tourism activities was around 1.5 billion (Web-1)¹. This equates to approximately 4.6% of the world's population.

The second group, which is the main subject of research, is the refugee movements. This movements that has reached the levels of millions coupled with the difficult journeys, which named as a refuge in a country . People who believe that they have no way of living in their own countries in general, to achieve better living conditions and to ensure their safety will go to other countries in illegal ways. After these journeys under uncontrolled and unhealthy living conditions, these people, who have been deprived of many health facilities in the host countries, have

¹ States have a right to control the entry of non-nationals into their territory. While they have to protect their external borders and safeguard public order and public health, they also have a duty to protect people's fundamental rights. These safeguards are stemming from EU law and CoE instruments, as they apply at the EU's external borders, bearing in mind that relevant CoE instruments apply to all borders". <https://www.coe.int/en/web/portal/-/fundamental-rights-of-refugees-and-migrants-at-european-borders>

become threatening health safety both for themselves and for the countries they shelter today. Although this issue has been one of the main topics on WHO agenda for a long time, states cannot reach to a solution due to the economic and political situations and social pressures.

This study will be structured on the examination and interpretation of official reports, based on the refugee movements and health security dimensions. The main hypothesis of the study is as following: Regional conflict, terrorism, hunger and misery that threatening human life cause an increase in refugee movements. This increase poses risk for global health security on an international scale. The lack of international co-operation on this issue will lead to multiple global levels of health problems much greater than the threat posed by Covid 19 pandemics.

In this framework, refugee movements will be examined in the first part of the study, and in the second part, the refugee health problems reported by WHO will be revealed, and in the third part, the measures to be taken to prevent this threat will be evaluated.

An overview of the global refugee problem according to statistical data

According to the UN International Migration organization (UNIMO), which now deals with asylum seeker and migrant issues on a global scale, the immigration does not have an international definition as a specific concept (Web-2). Countries generally carry out their legal system by setting up some criteria according to their duration of stay. At this reason, the definition of immigrants continues to change from country to country with special scope content.

Therefore, the global definition of immigrants is used for anyone who works, lives and tends to stay, whether going to a different place in his own country or another country. Over time, immigration has taken on a different structure. The migrants who spent many years in other countries were able to reach the second or even third generations during this period.

Some countries have generally granted citizenship status to second-generation immigrants. Therefore, from the perspective of health security, which is the subject of the article, some groups of immigrants have obtained citizenship and all the social and health assurances of the host country. It is realized that the vast majority of them have either limited access to health care or have no access at all (Web-3)³. However, as the definition problem persists, people who enter or try to enter different countries illegally are also included (Web-4)⁴.

However, to make an acceptable classification, immigration definition is a general descriptive concept given to people who came to another country legally, gaining residency and citizenship status in the following periods after fulfilling the desired issues (Web-5). In particular, this issue is included in minority and autochthon public statements in the European national minority framework agreement (Web-6)². Therefore, although there is still no fully specific definition in international law and agreements, the definition for the terms immigration, asylum seekers and refugees have to be considered separately.

In this context, refugees/asylum seekers are groups of innocent people force to flee to other countries because of threats such as deteriorate living conditions, civil war or terrorism in in their own country. By terrible and dangerous journeys they enter the borders of other countries.

Some groups are being admitted over by border security guards in states, while others enter and live there illegally. After becoming a global problem, the UNHCR (The UN Refugee Agency) organization was established in the UN in 1950, and its mission has increased greatly over the years (Web-7). The definition developed by UNHCR is as following: Refugee; They are people who leave their country never to return due to misery, persecution, civil war or deadly threats and need international protection (Web-8).

It is possible to find the answer to the question of how much is growing in UNIMO research. According to researches (2019) , the number of people trying to make a living inside or outside their own country, whether migrants, asylum seekers or refugees, is around 272 million. This figure corresponds to 3.5% of the world population (Web-9). Since today's world population is 7.7 billion, therefore one out of thirty people is a refugee (Web-10)³. By analyzing figures shown in the table. 1, it can be seen that the number of immigrants enhances unchanged in parallel with the increase of world population. See table.1. According to statistical studies, 74% of the immigrants go to other countries to find a job. Groups of immigrants who have settled legally have been included in the health system of the host countries. However, the migrants have received various type of health care in different countries, and the lack of standardization in this regard poses a threat to social health security.

³ 272 millions de migrants internationaux en 2019, pour une population mondiale de 7,7 milliards de personnes : 1 personne sur 30.

Table 1. Comparing number of migrants and world population

Year	Number Of Migrants	The Rates Of World Population (%)
1970	84.460.000	2,3
1975	90.368.010	2,2
1980	101.983.149	2,3
1985	113.206.691	2,3
1990	153.011.473	2,9
1995	161.316.895	2,8
2000	173.588.441	2,8
2005	191.615.574	2,9
2010	220.781.909	3,2
2015	248.861.296	3,4
2019	271.642.105	3,5

Overall, 52% of immigrants are men and 48% are women. It is necessary to consider this distinction as an important statistical data because, there are common diseases carried by women and men, as it will be mentioned in the following sections, cases of women-related diseases, have emerged and reached high rates by refugees traveling to different countries.

Meanwhile, followed by the UNHCR many people have left their homeland for various reasons to take refuge illegally in other countries, particularly In Europe. In addition, because of the fatal problems they encounter during the journey, the health safety threat, they have created unintentionally becomes more important. Therefore, the main topic of this article is the importance of browsing the statistical data about asylum seekers to evaluate the health safety threat.

Reviewing UNHCR's 2019 refugee reports especially after 2016, illustrated that the number of people who leaves their home lands due to civil war, terrorism, human rights violations and misere/hunger are looking for another place in order to survive, is increasing. It has to be considered that many people, especially women and children, lost their lives during such terrible journeys.

When we consider health safety, as it will be explained in detail, most of refugees are carrier of the disease related to their homeland and or due to non-compliance with health issues and lack of cleaning during the journey. A significant number of infectious diseases come to host countries caused a threat for global health.

According to the statistics in the UNHCR database (2019), the total number of refugees who left their homeland for the reasons mentioned above are 70.8 million.

-20.4 million of them live in refugee camps established and managed by UNHCR.

-Only 5.6 million of these groups are Palestinian asylum seekers (Web-11).

-In addition, according to the data, 3.5 million asylum seekers are constantly looking for their place on the move.

-In 2018, 13.6 million people became asylum seekers.

-This means that an average of 37,000 people leave their homeland every day and 16% of the total refugees are hosted in developed countries.

-Only %16 of all refugees are being accepted at the countries developed. However, the main goal of all people in the case of refugees is to start a new life by being accepted to a developed country.

-In 2009 there were only 43.3 million refugees on Earth. But because of civil war in Syria especially between 2012-2015 and lack of any developments in Afghanistan, Iraq, Yemen, South Sudan and Myanmar It has reached to 70.8 million (Web-12).

Table 2 shows the refugee / country classification, based on UNHCR data that illustrate it as a major problem worldwide with Covid-19 virus pandemic which needs to further health care.

Table 2. Table Of Countries That Give The Most Refugees (Web-13)

COUNTRY	POPULATION	REFUGEE	EXPLANATION
Syria	Post 2010, It's Unknown	1,3 (Million)	Out of 6.7 million Syrian homeland
Congo	84.000.070	5,4 (Million)	The main reason is hunger
Afghanistan	37.000.000	5,1 (Million)	The main reason is Terrorism
South sudan	11.000.000	4,2 (Million)	Main reason Terrorism and civil war
Sudan	41.000.000	2,7 (Million)	Main reason Terrorism and civil war
Somalia	15.000.000	3,7 (Million)	The main reason is Terrorism
Nigeria	195.000.000	2,5 (Million)	The main reason is Terrorism

Iraq	39.000.000	2,4 (Million)	The main reason is war
Yemen	28.500.000	2,2, (Million)	The main reason is Terrorism
Myanmar	53.700.000	1,1 (Million)	The main reason is religion
Venezuela	29.000.000	3,4 (Million)	The main reason is misery

Table 2 illustrated that the majority of refugees have left their homelands in Asia and Africa to go to developed countries, to protect their lives. A significant number of 3.5 million people are constantly on the move and are looking for a place to live. Of these, 1.2 million travel out of their own lands, destroying any official documents determining where they belong. On average, approximately 25% of those disappeared and died during the journey. Today this situation has become a serious humanitarian and health problem. The answer to the question of which countries have large number of refugees is included in the table below.

Table 3. Countries with the most number of refugees (million), (Web-14)

Country	Refugee rate	Refugee origin
Turkey	3,7	3.6 of them are Syrian
Pakistan	1,4	The vast majority of Afghanistan
Uganda	1	South sudan
Iran	975.000	Afghanistan
Lebanon	1	Syrian (except Palestinians in refugee camps)
Bangladesh	1	Myanmar
Ethiopia	1	South sudan
Jordan	715.000	Syria
Germany	1,063	Syria - Afghanistan
France	368.400	Mixed

Meanwhile, it is emphasized by UNHCR that the refugees had to choose one between, living or dying, because their journey to reach developed countries is very sophisticated and challenging. They have to pass through many countries, it is survived life threatening several times along the way, and some of them die. They are often captured by the security services of countries. According to UNHCR, the situation in the homeland of refugees is so bad that they are making such hazardous trips, which are likely to cause death, in the hope that they will be able to find a better life in other lands.

A long terrestrial trip along with hunger, exposure to harsh climatic conditions and health problems. Especially it is so difficult for women, children, and elderly people to withstand in these terrible trips. Also they maybe are killed by many illegal terrorists or rogue groups along the way. All mentioned problems cause refugees to choose the marine route instead of terrestrial roads. But Mediterranean is the very big barrier for thoses humans.

For a long time the Mediterranean has been a priority choice for refugees because after sailing with a suitable vehicle, the exit points are the proper lands to build the lives they dreamed of. But now it rises in front of them as a barrier for going to developed countries. Considering the following statistical data indicates that crossing the Mediterranean is not easy at all.

Table 4. Refugees 'Mediterranean traffic (Web-15)

Year	Passed (alive)	Died
2014	225,455	3538
2015	1.032.408	3771
2016	373,652	5096
2017	185,139	3139
2018	141,472	2277
2019	123,663	1319
2020	3327	176
Total	2,105,096	19,316

In general, refugees entering the Mediterranean from the coasts of North Africa and Middle East traveling long distances to reach Cyprus, Malta, Italy, Spain and Greece. But this journey is very challenging. Both using stale boats and difficult marine conditions are fatally dangerous for refugee groups. When the figures in Table.4 are examined, it should be considered that the number of deaths is just estimated from statistical data.

It is a fact that the numbers mentioned above were actually much higher, since some of the boats are lost in the sea, many people have fallen and lost on the storm, and those who were died because of other reasons.

Especially in parallel with a huge increase after 2000, the European Union has taken a serious focus on this issue, implementing policies to take continuous measures in the Mediterranean and to stop and send back refugees who are wandering around. Because it is predicted that the refugees' uncontrolled crossing and dispersal on the Mediterranean coast are very frightening and is financially as a burden in the future (Web-16).

In the rapidly evolving civil wars around the world, the civilian population have similar reaction, Escape. Because they will either die or try their luck by running away. If they are lucky, they will be able to take refuge in regions in which organizations acting under the United Nations. UNHCR is working on this issue and keeping notes (Web-17).

The notes on the situation of people who had to flee because of regional conflict are very striking. For instance, by beginning of civil war in Rwanda in 1996, people started to flee and UNHCR personnel were informed about this situation. It would be estimated that, 20,000 people will take refuge daily. When the fleeing people began to reach the HCR area, more than 20,000 people per hour began to cross into the safe zone.

The number of asylum seekers who have escaped is increasing on a daily scale so that refugees arriving daily has risen to around 350,000-400,000. Therefore UNHCR teams were unable to provide food and health services, the security obstacles were broken and refugees are no longer followed¹⁷.

As it turns out, instead living in a world in peace, stability and abundance under state governments, there are many countries that facing disasters and people embark on a very challenging adventure to survive.

However, it is remarkable that they carry two kinds of threats with them. Firstly, they are the carriers of continental and regional diseases where misery is prevail. Secondly, during the difficult journeys, they are lacking from medical support, trying to survive by feeding spoiled foods, polluted water, and they take infectious diseases. Therefore, those who will reach to target countries are unintentionally become health threats for the host countries. In this regard, the investigations made by WHO are the first issue to be taken into consideration for countries receiving refugees.

How Refugees' Health Problems Become a Global Health Security?

In general, all strategies of global power centers serve their own interests. The concept of security is shaped on this basis in a conceptual dimension. Therefore, security and power has overlapped over time. In a long period of history, physical power elements were based on protecting the borders to be equal or superior to neighbors' power but in recent times it is not sufficient. Strategies that will be taken to control of economical resources, political resources, informatics and transboundary waters will be considered as military power.

Although it is trying to “securitization” to be perceived conceptually, Covid 19 pandemic, which threatened global health suddenly revealed that how the interest-oriented security structure they created independently is insufficient to be applied simultaneous with international organizations.

In the last century, world wars, cold wars, regional wars, international terrorism and conflicts lead to global chaos have made people to forget that the main threat may come with outbreaks such as COVID 19 pandemic today.

It is appropriate to evaluate the emerging threat as following. Any political and military units that constituted for security against diseases, which are spreading in a portable way, are ineffective against this threat. This threat has no friends and no enemies. Every color, every breed and every kind of power is the target. There is no legal limit. It is not a terrorist. It is not the United Nations force. It is not an official security in a country. It is just a threat on its own. It can multiply. It can vary. It can spread all over the world easily. As a result, this epidemic is effective enough to destroy the global civilization system, and how the Post-Corona period becomes a mystery on today's world scale.

WHO has also tried to warn about these issues over the past decade and is still continuing. However, these warnings were not clearly taken into account as necessary. This was aimed at strengthening the capitalist order, such as monetary capitals, stability in transporting of energy resources to the world markets, new markets for large companies, protection of democratic systems, and the destruction of dictatorial governments. Health systems are structured to provide citizens healthcare services. The pandemic that started from the beginning of 2020 also brutally affected the world's most rich countries. US first and European countries, which they play a significant role in the global economy, have failed in the fight against Corona.

It is worth examining the health safety threat posed by refugees worldwide, where global health security is at the forefront. COVID 19 pandemic will eventually be eliminated but it is the first to warn in terms of health threats to the world.

It was mentioned that the global refugee movement constitutes a problem for all states. From a general perspective, according to statistical data, the numbers of refugees are increasing each year. It would not be wrong to say that this number could increase further in the period following 2020, especially considering that the threat posed by COVID 19 pandemics will be much more in countries where health systems are not effective sufficiently.

In this section using reports and data prepared by WHO, we will review the extent to which the number of refugees and the continual orientation towards countries with low life risks will pose a threat to health security.

According to UNHCR's refugee camps and WHO's assessments on refugees arriving in host countries, refugees have two types of health problems. One of these, is non-infectious carrier disease, and the other is a direct potentially infectious disease.

In this regard, research by WHO in 90 countries examined the reasons why refugees were unable to benefit from health care. These reasons are briefly as following (Web-18).

- The principles of benefiting from health services vary from country to country. In most countries, health care is inadequate and expensive,*
- Refugees coming to the host countries face language problems and health services are inadequate due to cultural differences,*
- These people are severely discriminated and humiliated in most places,*
- Government administrations prefer to stay away and not help these people with the idea of that they will bring financial burden,*
- The difficult living conditions in the host countries prevent refugees to receive the necessary health care,*
- In some of the host countries, refugees are deprived of health care due to lack of specialist staff and increased workload.*

In addition, warnings issued by the WHO are collected on two main topics. Firstly; the health measures that countries try to take on their own, are inadequate as they vary from country to country and should be centrally managed as soon as possible. Secondly; since refugees remain uncontrolled and they do not receive adequate health care, caused increasing levels of infectious and also non-contagious diseases that have not been seen before are beginning to appear in host countries. In this context, according to WHO, the health safety threat is divided into three parts.

- Carrier, but diseases that can pass to someone else in blood and different ways,*
- Those with spreadable properties,*
- Those whose risk of spreading is due to the poor living conditions faced by asylum-seekers on the traveling way.*

Refugee movements are considerable from two dimensions in terms of health safety. The first is that by traveling for months in poor living conditions and mostly without any health and hygiene support, the illnesses progress further and those who leave without illness also become sick. Secondly, due to living under difficult situation in their homeland they try to flee to the host countries while they are

carriers of diseases specific to their geographies. By considering that refugees reaching 3.7% of the world's population on a global scale, these two important dimensions indicate how is enormous the magnitude health safety threat posed by refugees.

In a general framework, there are different types of difficulties in host countries such as, high health expenses, cultural clash, discrimination and avoiding treating these people flexibly due to their being conservative, difficult living conditions, lack or absence of specialist personnel for refugee's type of diseases. Since the deficiencies are vary from country to country and standard procedures cannot be implemented, a common health security cannot be created and it poses a health safety threat to the society (Web-19).

Meanwhile, refugees who come with the disease can infect the people in the host country also most refugees avoid going to hospitals for fear of being deported by authorities, they brings additional financial burdens to the country's budgets in the provision of free medicines.

Especially because of consuming bad food and poor nutrition, not being able to do their personal cleaning, and not finding clean fresh water during the trip, women and children become ill at fatal levels. For a long period of time it has been the WHO's most prominent issue, and has taken two proposals to member states as following (Web-20).

*-To create cooperation on health safety with the participation of member states,
-Uniform training program is being created to ensure that refugees are not health safety threats in host countries.*

By investigating the refugee movements, two issues become important: These are travel routes, possibilities of entry from the borders and accommodate in host countries. The journey part is very remarkable. Because three types of routes are used: by land, by sea and both by land and sea. About sea routes, refugee movements in the Mediterranean immediately come to mind. Challenges and deadly characteristics of journeys in the Mediterranean have been shown in statistical data in the previous section.

The health problems faced by refugee groups during these journeys, whether on land, by sea or in both ways, definitely pose a health safety threat to the host countries.

It can spread within the continent by infecting refugees, those who meet them, those who helped them, and the state security elements assigned to control them.

According to WHO's general assessment, the diseases carried by refugees are mostly caused by traveling in unhealthy environments, using dirty fresh water, inability to find hygiene facilities and malnourished. In general, intestinal infections and respiratory disorders are seen. However, since these people are unable to get treatment, their diseases are largely chronic, progressed and some, result in death.

This is a serious threat for social health security mostly for European countries that receive the most migrants and Turkey, acts as a bridge in the Mediterranean because refugees can find a way to cross after a while and spread across Europe.

In this context, countries are divided into two groups: Direct refugees areas and indirectly affected areas. In both cases, however, all countries face the health-safety threat posed by refugees. The most important reason is that there is wide range of unrestricted human movements, from tourism to education, whether they are refugees or not. While host countries seem to be acting more consciously, it should never be ignored that these countries impose a significant financial burden to their health systems.

The hosts countries will accommodate refugees, who are in a difficult situation, in temporary camps, provide them health care services and trying to prevent them from dispersing.

According to the WHO's assessments, when these healthy services are provided to the refugees, their situation will improve in a short time. Nevertheless, diseases that have previously been reduced to zero, such as tuberculosis, hepatitis, measles, rubella, polio, typhoid, cholera, are increasingly seen in European countries because of deterioration of the host country in the initial care, losing control and causing refugees to disperse, also other European countries do not provide care due to financial problems and some of the refugees are hiding health complaints for reasons such as cultural and legal fears (Web-21).

Therefore, according to researches conducted since 2000, not paying adequate attention to refugees caused diseases (TB, malaria, cholera, typhoid, measles, polio etc.) increasing to 30% in some countries and are still rising in Europe.

Another example of the link between the refugee movement and health security is given in the Middle East. Middle Eastern refugees, most of them Syrian, who had to flee Syria and entered the borders of European countries in different ways,

caused the spread of the Oriental Boil (Leishmaniose) disease which is exclusive only to the Middle East was also seen in people living in Europe.

In addition, typhoid emerging in poor living conditions and Salmonella outbreaks that have long been seen at sea has reached to remarkable percentages across Europe. Also, the bacteria of diseases that are exclusive to tropical climates have also started to appear in different European countries. In terms of their purpose for travelling to Europe countries such as tourism , education or business, they will be as carriers for various diseases and also the risk of spreading diseases within society when they come back to their own countries.

Fever and respiratory diseases such as tuberculosis, occur during the long and arduous journeys and spread easily because of not having opportunity to cure and not enabling to find treatment. According to the evaluations, it is possible to come across tuberculosis in one of every 35 people in Europe and based on available data, tuberculosis has reached a level of 10% across Europe (Web-22). One of the most common diseases is Hepatitis transmitted on contacting and its rate remains above 10% with an unavoidable increase. It is evaluated to have a ratio of up to 40% in Central and Eastern European countries and 20-40% in Western Europe (Web-23).

Malaria is the most common spreading disease. Greece is seen as the starting point of expansion, and its origin is Pakistanian refugees. Although there are different varieties, according to WHO's assessments, Pakistan and Afghanistan are the main centers of Malaria (Web-24).

As it turns out, refugees are from countries where they have poor health systems and due to living in poverty and anxiety, they eat and drink what they can find during the journey. When they arrive at their destination, they are either sick or they carry diseases. If the host country provides healthcare consciously, recovery rates will increase and the probability of spreading will be decreased.

However, according to the health assessments of refugees who have reached developed countries, diseases that have not been seen for a long time have been appeared. Usually, diseases such as Salmonella, Shigellose ,campylo bacteriose, norovirus Hepatitis A, HIV, Middle Eastern origin MERS and food poisoning have been detected and are easily spread ingested in Europe or another continent due to the host country careless behavior. Moreover, the threat is not limited to the host country. Because diseases are carried to other countries by different means easily. For example, Cholera, known as hot climate disease that can be seen everywhere in Europe at 20-30% per annum (Web-25).

All mentioned diseases are repeated in the refugees' camps before ending. In addition, during the treatments procedures, antimicrobial and antibiotic resistant diseases are detected, In general, it has been found that in some resistant diseases such as influenza, tuberculosis, HIV and Hepatitis derivatives, the rate of spread is so high. Since 2015, 670,000 cases have been identified resulting in 33,000 deaths across Europe and looking at the last two decades, sexual and female genital disorders (reduction of genitals) have now been one of the most common problems in Europe. It is concentrated mainly in Belgium, Norway, UK and Sweden.

Measures envisaged by the WHO

First of all, the reasons for falling into refugee status are very important. The discourse voiced by UNHCR on this issue actually explains everything. That is as following; “ *If the living conditions of these people where they come from, are improved, no one will want to go on such a difficult and dangerous journey that most probably will end with death* ” (Web-26).

Terrorism, civil war, famine, economic inadequacies and illegal activities that cause people to be stripped of their lives in Africa, Middle East and Asia cause people to leave their homeland. As mentioned before, almost all of those who survived the journey, arriving host country, as they are patients. Some of them can't be tracked on which side they've reached because they're illegally logged in. As a result, being deprived of health services in a bad situation, they can spread the diseases they are carrier of.

Warnings are issued by WHO constantly , emphasizes the health threat that refugees create in the host countries, measures and practices have to be taken, are explained. Accordingly, the recommended measures are as following;

- *National health organizations actively engage in international cooperation under the direction of WHO, Whether or not they have refugee problems in their own territory,*
- *Providing the necessary health services to the refugees entering the countries to a sufficient extent and paying the same attention to the new arrivals,*
- *Keeping refugees under control, using specially trained personnel, opening up the information obtained to international cooperation,*
- *Taking healthcare precautions, especially using antibiotic and taking measures against antimicrobial diseases ,*

- *After initial controlling, refugees should be separated according to their health status ensuring those who are healthy will not get sick,*
- *Establishing the same control systems for countries without refugee problems,*
- *By applying health tests for HIV, hepatitis, tuberculosis, infectious tuberculosis, malaria, anthrax, the detection of common contagions in their homelands and then isolation and treatment of those who are carrier,*
- *Emphasizing necessity of identify those who are in special situations such as drug addicts has been stated that these recommended considerations should be made similarly in all countries. However, some priorities are also envisaged.*
- *A lot of attention is drawn to improving the quality of health services for refugees, having a serious training on healthcare personnel to provide services.*
- *In addition, it is considered that refugees impose additional burden to budgets of healthcare, which has an important place in the country's economies. Therefore, within the scope of international cooperation it is proposed to provide financial support to countries that host many refugees.*

WHO emphasized that each country has different protocols and budgets on health care, therefore the diseases will be spread in countries which, they have poor health security system and not providing sufficient health care for refugees will threatening the health safety of societies. This turns the hosted countries and also border countries into a terrible swamp Therefore, to provide mass health security there is need to efficient health care and adequate controlling system of borders. To achieve this, protocols to be carried out in international cooperation and a separate budget under the WHO authority is required.

In this regard, in the beginning of 2020, “PHAME” project which started in 2012 by WHO, was put into operation. Although many projects previously carried out by UN countries have not achieved the intended success, planners hopefully believe in success of this project to acquire the societies’ health security. COVID 19 pandemics caused this project to be suspended for a while.

The project generally covers the Mediterranean which has the most refugee flow. Therefore, this project including Mediterranean border countries and those has coasts to the Mediterranean area. PHAME has a specific importance of being as a substantial step to eliminate the problem of refugees related of health security worldwide. The main purpose of the project is to carry out common protocols, joint trainings and the same health safety procedures for refugees and integrated operation under WHO controlling.

Analysis of the threat imposed by refugees to Global Health Security and conclusion

UNHCR made a designation. If these people's lives do not turn into danger, why would they have to leave their homeland?

In fact, this is the most important reason behind the refugee crisis, which has turned into a multidimensional problem on a global scale. The international political discipline, which started to become imbalanced especially after the disintegration of the USSR in 1990, made even non-problematic countries in trouble. In order to overcome the global security crisis, “*securitization*” has to be re-examined in a conceptual dimension.

A vast geography stretching from Afghanistan to Iraq, Yemen to Africa, from Somalia, Sudan, Nigeria, Congo and Libya to Venezuela in Latin America has turned to terrorist groups' region and riots, civil wars, starvation and misery, have increased much more. As a result of kidnapping, children's terroristization and the detention of girls and women, innocent people began to leave their homeland in order to survive, and their number increased to uncontrollable levels (Web-27)⁴.

In this sense, 2018 was a disaster. Per minute, by leaving their homeland, 25 people trying their luck as a refugee elsewhere (Web-28). They just have to flee to survive. Therefore, in today's circumstances, global security efforts have actually become a relative activity that leads to the creation of insecure regions. Because the obstacles preventing of security could not be eliminated by military, political and economic plans, it just caused more chaos. The concept of security is reconsidered in terms of various dimensions.

Modifying economic, political and military structures and trying to develop new perception of “*security*” concept in terms of today's world status have always been included in these efforts. However, the conditions in which health security will become a global threat are the most significant issue that is not taken into consideration sufficiently. Studies have been included in the WHO's agenda and recommendations have been sent to countries. However, by 2020, Covid 19 outbreak, illustrated the importance of global health safety.

In the later stages of the outbreak, WHO worked accompanied with UNHCR and all the institutions related to human mobility. For example, WHO announces that after the overcoming of COVID 19 pandemic, by coordinated studies, they will create a tourism structure emphasizing health safety. However, according to

⁴ When my nine-month-old daughter died because of the lack of medicines, doctor or treatment, I decide to take my family out of Venezuela before another one of my children died. Diseases were getting stronger than us, I told myself, either we leave or we die.

UNHCR reports, refugees will be the priority of health security in the future. Health threats created by refugees are increasing day by day.

It causes the host countries to be unable providing them adequate health services and controlling systems. Moreover, It does not seem possible to prevent these movements in near future.

Follow the protocols determined by WHO and UN, some priorities are striking. Analyzing statistical data illustrated that refugee-related health safety issue is considerable from two aspects. The first is that people leave their homeland embarking on an unknown journey as if they were been throwing off the cliff. With the terrorism, civil war, human abduction and attempting to engage people in illegal activities, a deadly chaos environment emerges that lead to destroying the state order caused countries devastating and misery.

Despite the intervention of international community in these issues by different techniques the struggle in Iraq, Afghanistan, Yemen, Africa, Somalia, Sudan, and Libya caused the environment to become more chaotic. Since there is no consensus in the UN security council, the international peace mechanism has been remained ineffective. It can be see in Libya, Yemen, Syria and Sudan. It caused to extending chaos and people to leave their homeland to survive.

However, Corona virus pandemic demonstrated that health security will no longer remain regional and can inexorably extend to a global scale. Therefore, “*securitization*” is now the most significant issue has to be considered in the field of human being health. It is also clear that health security cannot be carried out in such global pandemics with the logic that each country will take care individually. For acquiring health security, it is imperative to be operated in a global scale integratively.

The second issue is about refugee movements. When the mentioned statistical data are examined, it is revealed that, especially after the COVID 19 pandemic, refugee movements will increase in the coming years. Because due to Corona outbreak, their life fall into worse conditions.

The important issue is the situation of the host countries. They have to act in a compatible way with human rights not keeping people who are refugees out of the borders due to necessities. However, the important points are lack of common procedures, financial resources and specialized personnel, and most importantly, coordinated implementation within an international system.

Therefore, it is necessary to create a new system by WHO in each country. Within this system contributing state administrations, UNWHO structures must be created and people , who are trained in the field of refugee health safety , should be recruited. It is necessary to create “Instant Reaction Elements “will be able to quickly respond to areas where refugee movements are concentrated and to base them in appropriate areas. Therefore, refugee movements should be eliminated from the countries' responsibility and should be given to international intervention. Thanks to the system to be created in this way, more assistance will be given to refugees, and effective interventions can be made against the health safety threat imposed by these people who are forced to flee only to save their lives.

Bildiyimiz kimi, təhlükəsizlik anlayışı bu illər ərzində nisbətən dəyişmişdir. Xüsusilə 1990-cı ildən sonra dünyanın birqütbləşməsindən fərqli müxtəlif coğrafiyalardakı terrorizm, vətəndaş müharibəsi, aclıq və aclıqla əlaqəli səfalətlə əlaqədar olaraq əsas torpaq sahibləri məcburi köçkünlüyə yönəldi. Zaman keçdikcə rasionalistə çevrilən insanların sayı artmağa başladı və bu gün qaçılmaz, beynəlxalq bir problemə çevrilmişdir. Bu səbəbdən ÜST tərəfindən aparılan araşdırmalara görə ev sahibi ölkələrdə əvvəllər görülməmiş müxtəlif xəstəliklər yayılmışdır. ÜST (Ümumdünya Səhiyyə Təşkilatı) və BMT -Birləşmiş Millətlər Təşkilatının Qaçqınlar üzrə Ali Komissarlığı tərəfindən keçirilən görüşlərdə verilən tövsiyələrdə bu problemin yaxın illərdə daha da artacağı bildirilir. Xüsusilə 2020-ci ilin əvvəlində ortaya çıxan və qlobal bir epidemiyaya çevrilən COVID- 19 pandemiyası, fərqli ölkələrdə həyata keçirilən səhiyyə xidmətlərinin, ölkələrin əhalisi, yeri və zənginliyindən asılı olmayaraq, çox davamsız olduğunu göstərdi.

Məqalə, qaçqınların sağlamlıq təhlükəsizliyi üçün böyük bir qlobal təhlükə yarana biləcəyi fərziyyəsini irəli sürmək üçün hazırlanmışdır. Bununla bağlı təcili surətdə tədbirlər görməyin önəmli olduğu qeyd edilmişdir. Bu çərçivədə ÜST, BMT və digər beynəlxalq qaçqın təşkilatlarının işləri, hesabatları və statistik məlumatları analiz edilmiş və görülməsi lazım olan tədbirlərin irəli sürülməsinin önəmli olduğu bildirilmişdir.

РЕЗЮМЕ

Оценка угроз с точки зрения глобальной безопасности здоровья: проблемы беженцев (Нелегальных туристов)

Нахид МАЛАЗИЗИ

Как известно, концепция безопасности с годами относительно изменилась. Особенно после 1990-х годов, в связи с однополяризацией мира, терроризмом, гражданскими войнами, голодом и бедностью в разных географических регионах, крупные землевладельцы стали вынужденными переселенцами. Со временем количество людей, ставших рационалистами, стало увеличиваться, и сегодня это стало неизбежной международной проблемой. По этой причине, согласно исследованиям, проведенным ВОЗ, в принимающих странах были распространены различные заболевания, которые ранее не наблюдались. Рекомендации, сделанные на совещаниях ВОЗ (Всемирной организации здравоохранения) и Управления Верховного комиссара Организации Объединенных Наций по делам беженцев (УВКБ ООН), говорят о том, что в ближайшие годы эта проблема усилится. В частности, пандемия COVID-19, возникшая в начале 2020 года и переросшая в глобальную эпидемию, показала, что услуги здравоохранения в разных странах очень неустойчивы, независимо от населения, местоположения и благосостояния страны. Статья предназначена для выдвижения гипотезы о возможности появления серьезной глобальной угрозы здоровью беженцев.

Было отмечено, что в этой связи важно принять срочные меры. В этом контексте была проанализирована работа, отчеты и статистика ВОЗ, ООН и других международных организаций беженцев, и было отмечено, необходимость принятия необходимых мер.

Ключевые слова: Беженец, мигрант, здоровье, ВОЗ, УВКБ ООН, болезнь.
