

USING THE APPLICATIONS OF INFORMATION AND COMMUNICATION TECHNOLOGY IN ENGLISH TEACHING

Yuswin Harputra

Universitas Graha Nusantara, Indonesia

1. Introduction

Indonesia's educational outcomes have not been satisfactory. It notes the English Language Teaching (ELT) in Indonesia's education assessment indicated the low improvement. The practices require further improvement; if the system is to deliver the educational outcomes required by the emerging economy and the changing society, and offer fair educational opportunities (OECD/Asian Development Bank, 2015). Thus, the inequities in the distribution of teachers and resources across regions (Tobias et al, 2014) were found. The level of competitiveness of Indonesian human resources with other countries is still unsatisfactory. It needs the new of education model in Indonesia. In addition, there should also be pursued a structuring of quality education and continuously, which is adaptive to the changing times. An adaptive educational system may provide adaptive feedback on the correctness or quality of a response (e.g., correct / incorrect; excellent / poor) or an elaborated feedback (Le, 2016). Utilization of Information and Communication Technology (ITC) for education, especially English language learning, has become a necessity that cannot be delayed anymore (Ghavifekr, 2016). It is suggested that incorporating ICT into the English curriculum can improve writing and reading skills, develop speaking and listening skills and support collaboration, creativity, independent learning and reflection (Ntongieh, 2016).

In globalization era, the knowledge is to increase productivity becomes vital (Vali, 2013). Contemporary education has become so advanced that ICT is now part and parcel of the teaching and learning process (Mafuraga & Moremi, 2017). Various ICT applications are available in the community and are ready to wait to be optimally utilized for educational purposes. Utilization of information and communication technology for education can be implemented in various forms in accordance with its function in education (Pandolfini, 2016).

This study focuses on the use of ICT in the formation of linguistic competence of students of universities in learning foreign language. It is argued and proven in practice. Conducted pedagogical experiment showed that the use of ICT has a positive impact on the quality of teaching a foreign language. Finally, the study demonstrated that the integration of ICT in the process of teaching a foreign language makes it more dynamic, information-intensive, helps efficiently organize the learning process, increases the efficiency of formation of communicative competence, provides a positive motivation of learning and cognitive activity of students, facilitates the activation of independent work of students (Bilyalova, 2017). The studies in anthropology, which cover the usage of language suggested the development of language policy and teaching English as a main foreign language in education system of Indonesia need cultural skills (Matondang, 2014).

2. Literary Reviews : Teaching with Technology

Teaching process has been intevened by new technologies. In developed countries, education has been successful integrated with linguistic, political, and economic integration (Collin & Karsenti, 2012). ICT supports the modern principles of learning and language acquisition. Individualisation, interaction and student motivation, often considered paramount in modern education theories, are necessarily a part of the process in ICT (Mullamaa, 2010). In any educational system, the level of available resources places a restriction on the degree to which any new subject can be introduced into the school curriculum, especially where only the most basic facilities have so far been provided. But ICT is of such importance to the future industrial and commercial health of a country that investment in the equipment, teacher education, and support services necessary for the effective delivery of an ICT-based curriculum should rank high in any set of government priorities (UNESCO, 2002).

Therefore, Stošić (2015) argued that the function of information and communication technology in education can be divided into seven functions, namely: (1) as a repository of knowledge, (2) as learning aids, (3) as educational facilities, (4) as a standard of competence, (5) as administrative support, (6) as school management tool, and (7) as education infrastructure. Referring to the seven functions can be understood that ICT can contribute significantly to improving the

quality of life of Indonesian society, especially in education. Therefore, the main purpose of the activity is the business socialization of information and communication technology applications in contributing significantly to improving the quality of life of Indonesian society. Furthermore, in the development of ICT for education

The low quality of human resources in Indonesia is indeed not separated from the results achieved by the education of Indonesia so far and, admittedly, there are still many problems facing education Indonesia. Low quality of human capital relates to the lack of focus and clear strategies to develop its education system (Adam & Negara, 2015). So far, the educational outcome is only visible from children's ability to memorize facts. Although many children are able to present a good level of memorization of the material it receives, in reality they often do not deeply understand the substance of the material. In learning English as a language of international communication can be developed along with the advancement of science and technology arts developed at this time can actually be grasped in the hands of students without a matter of seconds. Through the internet, learning English becomes more interesting. The application of internet technology has developed a new field for autonomy English learning which is becoming more and more popular at home and abroad. Learning English with the Internet can create efficient and high-quality achievement in personal or mass English learning. More and more people start to pay attention to it and study how to make a full use of it (Higgins et al, 2012). As for studying a foreign language, by means of the Internet it is possible to improve the language skills considerably as well as to learn it practically from scratch. It is feasible by means of special services which allow not only to learn a language online but also to contact to the native speakers, to watch videos in a studied foreign language with the necessary comments on the lexical structure of a video (Molchanova, 2015). For that, it is necessary steps of innovation of ICT-based English learning in order to increase quality education of the Indonesian nation.

2.1. Teaching Media

Technology can perform several key functions in the change process, including opening up new opportunities that improve teaching and learning particularly with the affordance of customisation of learning to individual learner needs, which is highly supported by the learning sciences (Groff, 2013). The educational potentials of using information and communication technology (ICT) brings new possibilities and constraints when facilitating *or* in the facilitation of student learning. Technology-enhancement may be understood as “effective teaching”(Fry in Fossland, 2016). It involves the effective teaching, supervision, assessment, and planning. The digital innovators demonstrate that ITC had the potential to change assessment methods that enhanced the students' learning as well as; it was making more effective and efficient compared to the previous

(traditional assessments). The teachers had an opportunity to enhance the students' learning through assessing broader aspects of what they had learned.

ICT is a scientific, technological and engineering discipline and management technique used in handling information, its application and association with social, economic and cultural matters (UNESCO, 2002). ICT stands for Information and Communication Technologies. ICT is a part of our lives for the last few decades affecting our society as well as individual life. ICT which is now broadly used in educational world. Teacher, Student, administrator and every people related to education are popularly used ICT. Teacher use ICT for making teaching learning process easy and interesting. A competent teacher has several skills and techniques for providing successful teaching. So development and increase of skills and competencies of teacher required knowledge of ICT and Science & Technology (Bhattacharjee & Deb, 2016).

It is necessary that future research explores whether both models of use found are still being used in the new classroom contexts, where technology increases even more with the arriving of mobile devices (brought by students in many cases) and to what extent teachers readapt these patterns according to the increase of their experience in the educational use of ICTs. Different authors have tried to identify the typology of ICTs used by teachers. The work of Barron and others (in Moreira et al, 2016) is here of particular significance. They identified four types of ICTs use in classroom teaching: the computer as a research instrument for students, as a tool for problem solving and decision-making, as a production instrument (for the making of reports and papers), and lastly, as a communication resource.

In order to achieve effective implementation of ICT in education a great variety of factors should be taken into consideration, among which is the enhancement of teachers' professional development and training provision. Teachers should be provided not only with basic ICT skills but also with skills that have pedagogical grounding. All efforts should be made to develop teachers' own skills so that they could pass on these skills to the younger generation (Voogt in Zhelezovskaia, 2016).

2.2. Teaching English with the ITC Applications

It is believed that the education is a key factor in the development of the nation and the country. The two main issues they commonly face are improving the quality and expansion of learning opportunities. The fundamental questions in addressing these issues are (1) how to improve the quality of education in all channels and levels so as to produce people and generations that can contribute to society, nation, country, able to live and compete in the global world but without

losing their national identity , and (2) how to provide the widest possible education and learning services to all children and their citizens regardless of their ethnic, religious, socioeconomic, gender, location and physical condition.

These two problems are not easily solved together. It is given the various limitations that exist so often the attention given on one side suspends the handling of that side other. However, with the existence of ICT (Information and Communication Technology) is believed as one of the strategic ways to overcome the problem. Effective Teaching found that the use of ICT in the classroom gives the impact of increased enthusiasm and high on-task behavior in students in the task, because students get new and different (novelty effect). The positive results of the study clearly encourage the use of ICT in learning English to innovate learning. This effort is in line with the program of the Ministry of Education through PMPTK which is committed to developing ICT in education. However, in order for the step of ICT use in learning English to run optimally, it would require a synergistic step from various parties, including professional teachers. That is, teachers are able to have an insight into the use of ICT as well as competent in the scholarship of English and learning. This is in line with the research of Ghavifekr (2014), the study indicates that most of the teachers are more likely to use ICT applications and resources for educational purposes, such as the Internet, multimedia computer, projector system, PowerPoint presentation, or word processor programs during the teaching and learning process. At the same time, the advanced usage of ICT like build a learning website or creating learning software such as educational games appear to be rarely used in the teaching and learning process or even preparation for educational purposes

ICT can be used in various ways where it helps both teachers and students to learn about their respective subject areas. A technology-based teaching and learning offers various interesting ways which includes educational videos, stimulation, storage of data, the usage of databases, mind-mapping, guided discovery, brainstorming, music, World Wide Web (www) that will make the learning process more fulfilling and meaningful. On the other hand, students will benefit from ICT integration where they are not bounded to the limited curriculum and resources, instead hands-on activities in a technology-based course is designed to help them to stimulate their understanding about the subject. It also helps teachers to design their lesson plans in an effective, creative and interesting approach that would result in students' active learning. Previous researche (Ghavifekr, 2015) proved that use of ICT in teaching will enhance the learning process and maximizes the students' abilities in active learning

2.3. Concept of Innovation of ICT-Based English Learning

The term innovation gives the view that there is something new, unique and interesting. The novelty, uniqueness and attractiveness must lead to expediency. Humans as dynamic social beings and dissatisfied with what is already there will always try, dig and create something 'new' or 'other' than usual, as well as innovation problems that are closely related to the learning process. Furthermore, the term 'new' in innovation can be interpreted as anything that has not been understood, accepted or implemented by the recipient of innovation (students). Thus, ICT-based ICT-based learning innovations can be realized with ICT-based learning tools. The tools include: (1) concept framework of Education Unit Level Curriculum, (2) Lesson Plan, (3) teaching materials, (4) media / props, and (5) evaluation of learning. Simply put, the concept of innovation in ICT-based English learning can be seen from the results of learning tools. The whole device is packed in an ICT-based learning format by not ruling out the communicative competence of students in learning a foreign language. The emphasis of learning still emphasizes the essence of language learning as a communicative means of students in knowing the surrounding the world. The impact of learning innovation in English is the birth of innovative teachers. Below is presented a picture of the concept of learning innovation learning ICT-based English language.

As a medium in the educational process, ICT offers several applications that can be done innovation in learning English (Kennah, 2016), such applications include as follows.

1. *E-learning*

E-learning or learning through online is learning that the implementation is supported by technology services such as telephone, audio, videotape, satellite transmission or computer. Such as courses or education with distance learning media (distance learning) and cyber classroom. There are three Internet-based learning systems in E-learning.

a. *Web Course*

It is the use of the Internet for learning purposes where teaching materials, discussions, consultations, assignments, exercises and exams through the internet or no face to face in the learning process. Like distance education process; virtual university.

b. *Web Centric Course*

Unlike Web Course, Web Centric Course emphasizes learning where teaching materials, discussions, consultations, assignments, and exercises over the internet. Trials, and some consultations, face-to-face discussions & exercises conducted in the lesser learning process. Like university off campus.

Even to create a wider network, existing applications in ICT are also channeled in the form of internet network. Until now this network has become a medium of learning and teaching that needs to be taken into account its usefulness. According to Mohammed & Ahmed (2017), the Internet is a network of thousands or even millions of computers, including local networks connected via channels (satellites, telephones, cables) and worldwide coverage. The Internet has many facilities that have been used in various fields including in the field of education. The facilities include: e-mail, Telnet, Internet Relay Chat, News groups, Mailing List (Mailing List), File Transfer Protocol (FTP), or World Wide Web (WWW). There are five internet stack applications that can be used for including e-mail, Mailing List (Mailing List), News groups, File Transfer Protocol (FTC), and World Wide Web (WWW) (Onno W. Purbo, 2002). The World Wide Web or often called the Web is the largest collection of documentation which are stored in various servers connected to a network (internet).

This document was developed in hypertext format using Hypertext Markup Language (HTML). Through this format it is possible to link from one document to another document or part (<http://www.livinginternet.com>). Actually, the internet was originally born for a military purpose in the United States. In early 1969 the Advanced Research Project Agency (ARPA) of the United States Department of Defense, created a network experiment called ARPAnet to support military research purposes. Internet application facilities are large enough to provide support for military purposes, the mass media, business circles, as well as the education community. In terms of its use for education, Galadze (2015) states that the world of education has entered its fifth revolution. The first revolution takes place when people give up their children's education to a teacher. The second revolution took place when the use of writing for learning purposes. The third revolution occurred along with the invention of the printing press so that learning materials can be presented through the print media. The fourth revolution occurred when the use of electronic devices such as radio and television for equity and the expansion of education. The fifth revolution, as it is today, with the use of advanced communications and information technology, especially computers and the Internet for education. This revolution had an impact on some future educational tendencies. Some of these traits, according to Ashby (in Miarso (2004) are as follows: the development of off-campus learning as a form of continuing education, people gain greater access from various sources of learning, the library as a learning resource center becomes a dominant feature in campus, scattered (spread) from the core campus in the center with the existing satellite campus in the community, the growth of new professions in the field of media and technology, and people are required to learn more independently.

Some forms of communication that can be done include the following (Bourne,2015):

(1) Electronic Dialog (chat); an electronic dialogue is a text-based conversation that can be done online at the same time (synchronous) between two or more Internet users. Examples of applications in the context of higher education, electronic dialogue can be used for the communication process between lecturers with some students in discussing a subject in a particular lecture.

(2) Electronic mail (e-mail); electronic mail is a form of communication not asynchronous (asynchronous) that allows the occurrence of communication between students with lecturers or students with other students through letters delivered electronically via the internet. Unlike chatting, this way the feedback obtained may be delayed.

(3) Group conference by mailing list; A mailing list is an extension of an e-mail where one can send a message to a specific group of people who have registered to join a discussion group. For example, a lecturer has a list of students who are members of a particular group of subjects. Assignment and discussion can be done through a facility like this.

(4) Teleconference; teleconference can be either an audio conference or a videoconference. Both of these conferences can be done by "point to point" or "multi point". The first way is done in two places while the second way is done in more than two places. For example, a teacher from a particular school can discuss a particular topic to students in several other schools at the same time. Advances in the world of ICT need to get a positive response in an effort to improve the quality of education.

3. Conclusion

This study concluded that the innovations of ICT-based English learning:

3.1.The existing ITC innovation in learning English would help any efforts in the teaching process, using various methods, approaches for the achievement of learning objectives. Therefore, it is necessary to create how it all has a positive attitude towards ICT; so that the use of new technology accelerates the distribution of education and development.

3.2. The mastery of English Skills with ICT now plays an important role in Indonesia to reach better English competences from elementary school to senior high.

РЕЗЮМЕ

Применение информационных технологий в изучении Английского языка

**Юсвин Харпутра
Университет Граха Нусантара, Индонезия**

Студенты наслаждаются новыми технологиями дома или в школе. В школах используют Информационные технологии при изучении английского языка. В данной исследовательской работе, были изучены технологические методы, используемые в курсе английского языка, для улучшения качества обучения английскому языку в Индонезии. Сделан вывод о том, что использование информационных технологий обеспечивает теоретическую поддержку студентам в процессе обучения и помогает им укрепить свои лингвистические способности. Информационные технологии посредством голосовой системы и записей на английском языке, помогают объединять речь и слова в более длинной форме, а также в конечном итоге, выбирать фразы. В то же время Информационные технологии также обучают студентов разнообразию использования языка.

Ключевые слова: Английский язык, информационные технологии, методы обучения, школа
